TECHNOLOGY CORP

Introduction

Efficiency of drug delivery through mechanical ventilation (MV) could be influenced by the ventilator, aerosol generator, placement of various equipment in the ventilation circuit, types of drug used, and the conditions of the patient.[1] Studies have illustrated that aerosol delivery efficiencies of both jet and vibrating-mesh nebulizers could be enhanced by placing device at the inlet of a heated humidifier.^[2-5] Traditional T-adaptors had suffered from significant aerosol impaction, thus reducing drug delivery efficacy.^[6] The aim of this study was to compare our novel polymeric vibrating-mesh nebulizer (µMVN+) against existing devices during MV with redesigned adaptors. Drug formulation influencing nebulizer delivery efficacy was also discussed subsequently.

Experimental Methods

- Vantilator & parameters: Puritan Bennet 760 ventilator (Medtronic Corp.), adult parameters (600mL, 16 breaths/min, PEEP 5cm H₂O).
- Drugs: A unit dose of salbutamol (Ventolin, 5 mg / 2.5 mL, GlaxoSmithKline) or budesonide (1.0 mg / 2.0 mL, AstraZeneca).
- Nebulizers: 5 aerosol generators, namely μMVN⁺4.0, μMVN+3.0, μMVN+2.0 (named base on particle size, MicroBase Tech. Corp., Taiwan), Aerogen Solo (Aerogen Ltd., Ireland) and JN (Galemed Corp., Taiwan) till dryness.
- Analysis methods: spectrophotometer U-2900 (Hitachi Corp., Japan) at a wavelength of 276 nm for salbutamol and 254 nm for budesonide (n=5).
- Particle characterizations: Each nebulizer was tested by Andersen cascade impactor (ACI) with a unit dose of salbutamol. Mass median aerodynamic diameter (MMAD) values were shown in Table 1.

Table 1. The particle size of five nebulizers with Andersen cascade impactor (ACI) tested with salbutamol (mean \pm SD).

| 1 (| , | , | , | |
|------------------|-----------------|-----------------|-----------------|------------------|
| Nebulizer | MMAD | GSD | FPD (mg) | FPF (%) |
| | (µm) | ดูงก | (<5 µm) | (<5 µm) |
| μMVN+4.0 | 3.99 ± 0.12 | 2.13 ± 0.09 | 2.68 ± 0.09 | 59.91 ± 0.01 |
| $\mu MVN^{+}3.0$ | 2.73 ± 0.36 | 2.35 ± 0.27 | 3.29 ± 0.42 | 74.11 ± 0.08 |
| $\mu MVN^{+}2.0$ | 2.06 ± 0.06 | 1.74 ± 0.24 | 4.15 ± 0.32 | 90.09 ± 0.03 |
| Aerogen Solo | 3.98 ± 0.37 | 2.11 ± 0.10 | 2.50 ± 0.38 | 61.18 ± 0.06 |
| JN | 1.46 ± 0.51 | 2.20 ± 0.36 | 1.05 ± 0.17 | 86.26 ± 0.06 |

μMVN+: MicroBase mechanical ventilator nebulizer plus.

MMAD: mass medium aerodynamic diameter.

GSD: geometric standard deviation.

FPD: fine particle dose. FPF: fine particle fraction.

Results & Discussion

In Figure 1, the inhaled dose of all µMVN+ which connected to second generation T-adapter was significantly greater than Aerogen Solo and JN (p<0.001). Table 2 showed the results of inhaled dose% for nebulizer-adaptor combination. The inhaled dose was raised by approximately 4-6% when µMVN⁺ 3.0 and μMVN⁺ 4.0 were used with the MBTC-SG T-adapter instead of the MBTC-FG T-adapter. Inhaled dose of Aerogen Solo was significantly greater than JN (p<0.001). Drug formulation influenced nebulizer delivery efficacy since the inhaled dose of salbutamol generated by all devices was significantly greater than that of budesonide (p < 0.001).

Table 2. Inhaled dose of salbutamol and budesonide with nebulizers combining with adaptors (%, mean ± SD).

| nebulizer | T-adaptor | Inhaled dose % | | p value |
|------------------|----------------------|------------------|------------------|---------|
| nebunzei | 1-adaptor | salbutamol | budesonide | p value |
| $\mu MVN^{+}4.0$ | MBTC-FG T-adaptor | 17.67 ± 0.78 | 13.75 ± 0.27 | < 0.001 |
| $\mu MVN^{+}3.0$ | MBTC-FG T-adaptor | 20.46 ± 0.66 | 14.12 ± 0.42 | < 0.001 |
| $\mu MVN^{+}4.0$ | MBTC-SG T-adaptor | 20.99 ± 1.00 | 17.94 ± 0.47 | < 0.001 |
| $\mu MVN^{+}3.0$ | MBTC-SG T-adaptor | 26.29 ± 1.56 | 18.40 ± 0.17 | < 0.001 |
| $\mu MVN^{+}2.0$ | MBTC-SG T-adaptor | 29.71 ± 0.76 | 20.31 ± 0.78 | < 0.001 |
| Aerogen Solo | Aerogen T-adaptor | 17.92 ± 0.43 | 9.50 ± 0.23 | < 0.001 |
| JN | commercial T-adaptor | 12.57 ± 0.70 | 6.39 ± 0.43 | < 0.001 |

MBTC-FG: MicrosBase Tech. Corp. first generation T-adaptor. MBTC-SG: MicrosBase Tech. Corp. second generation T-adaptor.

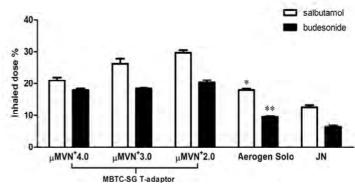

Figure 1. Comparison of inhaled dose % among the five nebulizers. *Inhale dose % of salbutamol by Aerogen Solo was significantly greater than JN(p<0.001), yet lower than all μ MVN⁺ (p<0.001). **Inhale dose % of budesonide by Aerogen Solo was significantly greater than JN(p<0.001), yet lower than all μMVN^+ (p < 0.001).

Conclusion

The newly designed polymeric vibrating-mesh nebulizer with a MBTC-SG T-adaptor enhanced aerosol drug delivery efficiency, possibly by reducing aerosol impaction and condensation during nebulization. Drug formulation influenced nebulizer delivery efficacy since budesonide suspension had resulted in a lower delivered dose.
